

Crosswalk Visibility Enhancement

When crosswalk striping and signage have been used congruently, it has been shown to enhance safety for motorists and pedestrians alike. Studies have shown crosswalk enhancements can reduce crashes by 23-48%. High-visibility crosswalks are typically installed to provide higher visibility compared to the standard parallel lines. To decrease the risk of a multiple threat crash, advanced STOP or YIELD signs and markings may be used for these projects. Sight distance evaluations may be performed to consider parking restrictions at the crosswalk approach to improve sightlines for the pedestrians and motorists.
